Submitted to: SAS3

https://github.com/NSU-SU21-CSE486-1/1811386_SU21_CSE486_1/tree/main/Project/Version02/quiz2
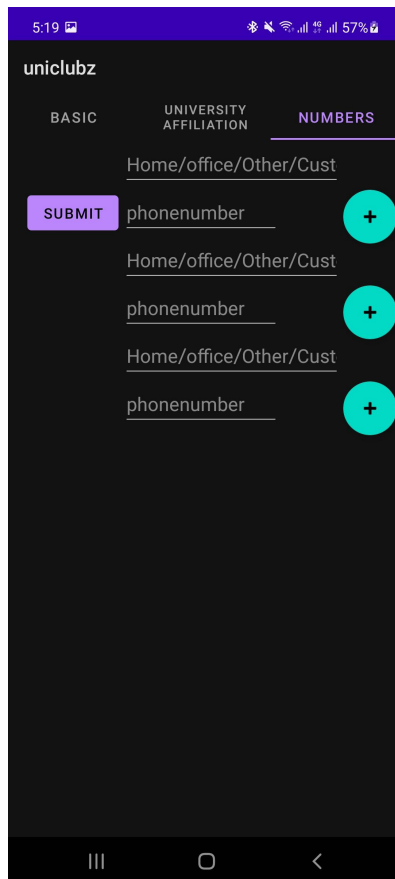

The project is made using java programming language and XML.

It is a very simple program . It open with taking four inputs from the user
Name, Date of Birth,NID,Blood Group. I implement a new layout called tab layout
Which has three items Basic University Affiliation and Numbers .

The University Affiliation is able to take multiple entries. The entries are taken in
multiple small fragments and can add upto three fragments which appear on a click of
a FAB.

The thrid tab item has also able to take multiple phone numbers as well.

On the clicking the submit button the information is supposed to carried over the a recycleer view and be displayed.

.

When we click in user name the rest of the information is supposed to show up.

I was unable to use serialization and parcel-able to transfer information through the recycler view and the two examples are hardcoded.
